

How to use the template

Please ensure the below plugin are installed in obsidian

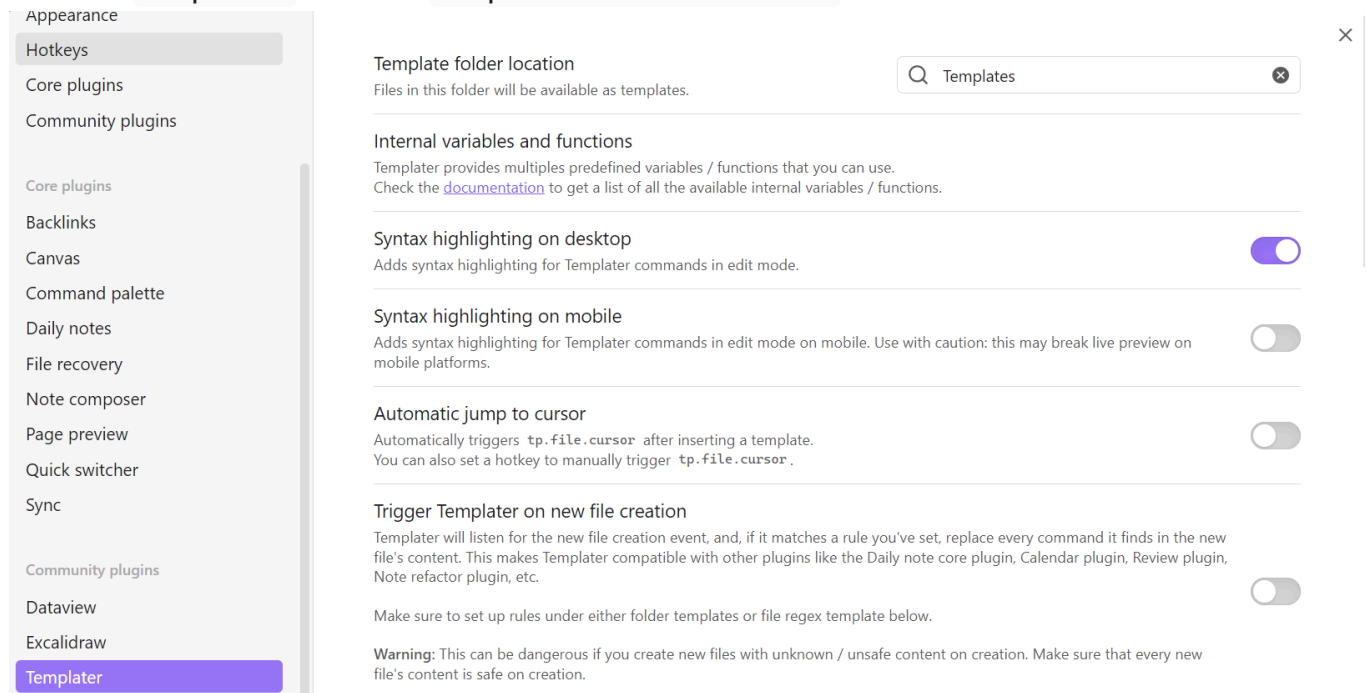

1. Dataview
2. Templater

Note: Please make sure core **Templates** plugin is disabled before installing **Templater**

and add **Templates** folder in **Template folder location**

Create a new files `Daily-Work-Template` inside folder `Templates`

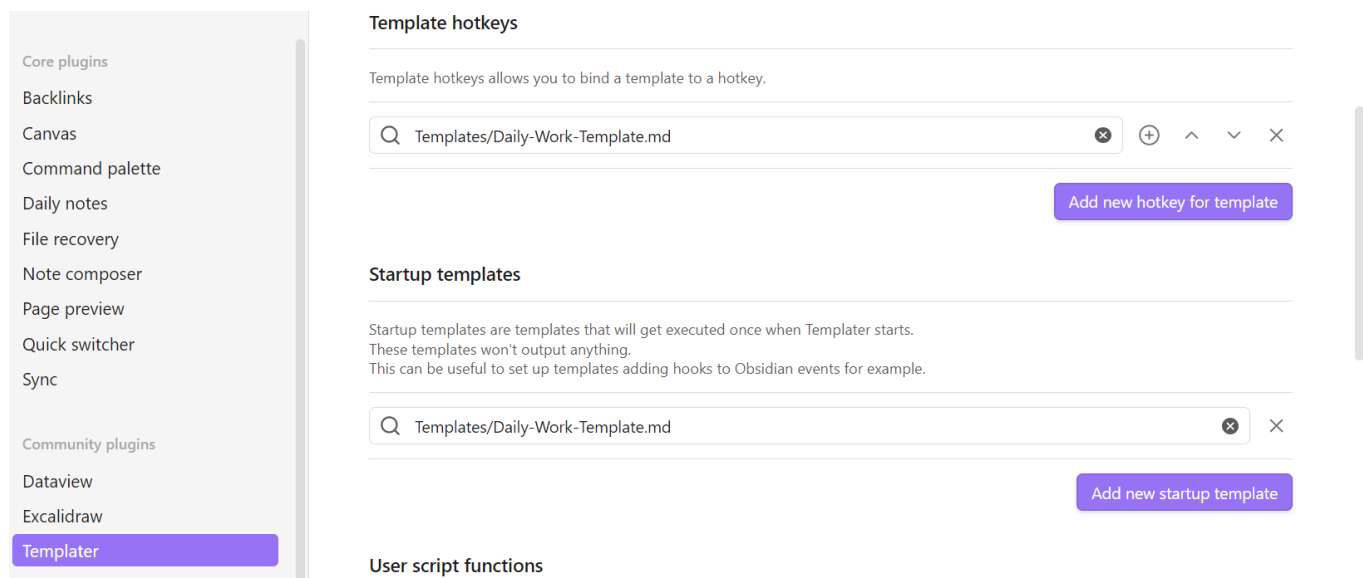

Note: You can choose any name of the file or the folder, Generally it is recommended to use `Templates` folder for create any templates.

Paste the below code in the `Daily-Work-Template` file or just put the files [Daily-Work-Template-1](#) in `Templates` folder.

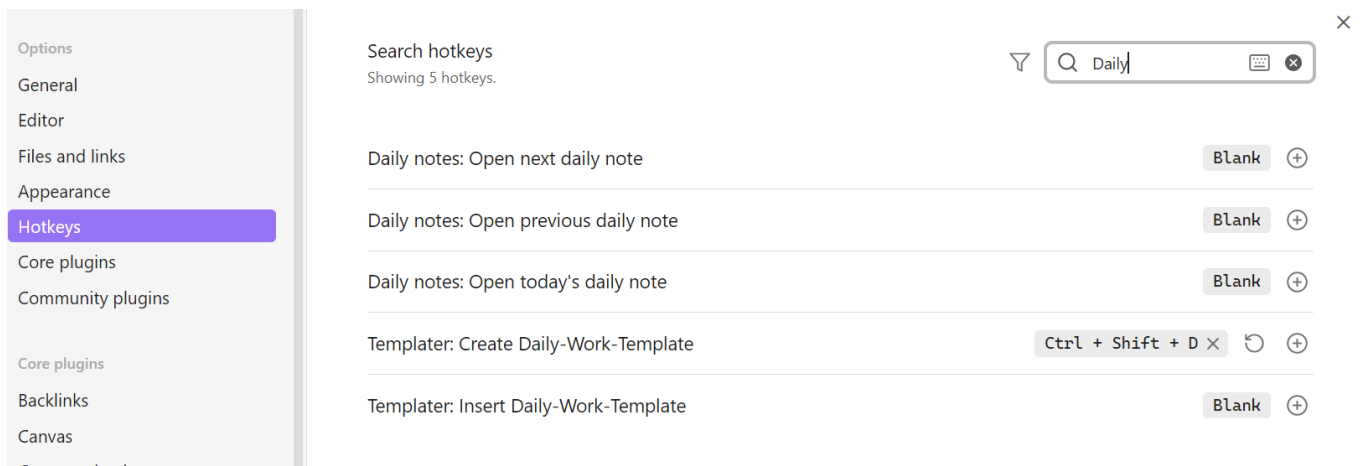

We have 2 options to create the template:

1. Template hotkeys
2. Startup templates

Setup and use hotkeys (for my case `ctrl+Shift+D`) for creating the templates. Additionally, you can also create hotkeys for inserting the template if needed:

Note: Using hotkeys will create a `untitled` file with log message  Created and opened new Daily Log for

If you setup this template in `Startup template` it will automatically run the script and create the file for that day.

Note: No worries, if file for that day already exists it will not create or modify it.

Happy Coding
